EDUCATION

Virtual University of Pakistan

B.S. in Computer Science

Relevant Coursework: Machine Learning, Natural Language Processing, Distributed Systems, Data Engineering, Software Engineering

TECHNICAL SKILLS

Languages: Python, JavaScript, SQL

Tools & Platforms: n8n & Lang Chain Expert | Delivering AI Automation for Clients (Upwork) | LLM Engineer • TB Harbor 2.0 | Building Agentic Workflows with n8n & LLMs | SWE • Docker • Lang Chain

Bench marking: OS world bench

AI Models Evaluation: 2.0, LLM Training, SWE bench, OpenClaw, Terminal Bench 1.0, Terminal Bench Harbor Framework, TB Harbor, Technical Expertise

Human Task Creation: Task Review, Training, Data Annotation, Natural Language Processing, Artificial Intelligence and Machine learning

Frame Works: React JS, Django, Google Maps

Others: Linux, Docker and containerized environments, Pytest, GitHub

PROJECTS

AI Workflow Automator — Python · LangChain · OpenAI API · Slack Webhooks 2024

- Built an end-to-end agentic system that reads incoming Slack messages, classifies intent with an LLM, and routes tasks to the correct tool (calendar API, Notion, email) — reducing manual triage time
- Implemented tool-use / function-calling patterns to give the agent access to real external APIs; iterated on prompt templates until production accuracy exceeded 90%
- Shipped a lightweight React UI for non-technical teammates to monitor agent logs and override decisions

RAG-Powered Knowledge Base Q&A — Python · LangChain · FAISS · OpenAI API 2024

- Designed a retrieval-augmented generation pipeline that ingests internal docs, chunks and embeds them into a FAISS vector store, and answers natural-language questions with cited sources
- Optimized chunking strategy and embedding model selection to reduce hallucinations on domain-specific queries
- Open-sourced on GitHub with a one-command Docker setup; 50+ stars

BizOps Dashboard Prototype — *React · Python · Salesforce REST API 2023*

- Prototyped a lightweight dashboard pulling live data from the Salesforce REST API and surfacing pipeline metrics with automated anomaly flagging
- Used iterative, scrappy development — built v1 in a weekend, refined with stakeholder feedback over 3 sprints

EXPERIENCE

Software Engineering Intern | Upwork

On Upwork, I've helped businesses eliminate bottlenecks by building multi-step AI Agents that connect CRMs, databases, Slack, and email automating decisions that used to take hours, down to minutes. My n8n workflows aren't just "if-this-then-that"; they are agentic, meaning the AI reasons, plans, and executes complex tasks before looping back for human approval or refinement.

Here's what makes my approach different: I'm not just a no-code/low-code enthusiast. I have a deep AI engineering background as an AI POD Lead where I specialize in RLHF and Supervised Fine-Tuning (SFT). I designed Terminal Bench (TB Harbor 2.0) and authored OS World Tasks to benchmark agentic reasoning. I bring that same SWE rigor containerizing with Docker, testing with pytest, and ensuring reliability to every n8n deployment.

What I deliver to clients:

Custom n8n AI Agents that integrate with your existing stack.

Cost-efficient automation that reduces headcount overhead on repetitive tasks.

Production-grade workflows that don't break when you scale.

Let's automate the boring stuff so you can focus on what matters.
